

erytromycine een plek zou moeten krijgen in de behandeling, dan is dat bij therapieresistente patiënten bij wie het voordeel van het gebruik van erytromycine opweegt tegen de nadelige bijwerkingen. In dat geval is de combinatie met metoclopramide aangewezen.

Verbetering

In het referaat *Perceptie van inhalatiecorticosteroïde voorspelt therapietrouw* [PW Wetenschappelijk Platform. 2008;2(5):117] staat dat bij de subjectieve rapportage over therapietrouw en bij de objectieve aflevergegevens negatieve correlaties werden gezien met de percepties van de noodzaak en van de zorgen. Deze correlaties waren echter positief.
